Register API

- What should happen in the register API?

Register API

Logic

- Check whether all required parameters exists
- Format of each parameter is correct or not
- Check whether already exists in the system
- If user does not exists
  - Hash the password
  - Save all details into database

Login API

- What should happen in the Login API?

Login API

Logic

- Check whether all required parameters exists
- Format of each parameter is correct or not
- Hash the password(same way it has been hashed while creating)
- Check whether email address and hashed password are correct
- If correct,
  - Generate the session/JWT tokens
- Else throw an error
